

5.2

Refactoring into a Module

250 PTS

After that we will need a way to encapsulate our directives in order to give our `app` access to them. We can use a module to do this! It is time for Module inception! There is a new js file provided for you — `products.js`; extract all store directives(descriptions, specs, reviews, title, gallery, and tabs) and paste them inside this new file. Then create a new module that we will make our original `gemStore` module require as a dependency.

Help Me

Task 1/4

Create a new Module named `store-directives` to encapsulate our store Directives.

```
1 (function() {
2   var app = angular.module("store-directives", []);
3 })();
4
```

Task 2/4

Move the Directive definitions from `app.js` into `products.js`.

```
1 (function() {
2   var app = angular.module("store-directives", []);
3   app.directive("productDescription", function() {
4     return {
5       restrict: 'E',
6       templateUrl: "product-description.html"
7     };
8   });
9
10  app.directive("productReviews", function() {
11    return {
12      restrict: 'E',
13      templateUrl: "product-reviews.html"
14    };
15  });
16
```

Task 3/4

Give `gemStore` Module access to the directives by adding a dependency to `gemStore`'s definition.

```
1 (function() {
2   var app = angular.module('gemStore', ["store-directives"]);
3
```

Task 4/4

Link in the new `products.js` file.

```
5 <script type="text/javascript" src="angular.js"></script>
6 <script type="text/javascript" src="app.js"></script>
7 <script src="products.js"></script>
8 </head>
```

5.4

Built-in AngularJS Services

250 PTS

We can use the built-in `$http` Service to make requests to a server (or in our case a json file). Give our StoreController access to the products using a service.

Help Me

Task 1/5

Inject the `$http` service into our `StoreController`.

Task 2/5

`get` the `store-products.json` using the `$http` Service.

```
1 (function() {
2   var app = angular.module('gemStore', ['store-directives']);
3
4   app.controller('StoreController', ['$http',function($http){
5     var store = this;
6     store.products = [];
7
8     $http.get("/store-products.json");
9   }]);
10
11  app.controller('ReviewController', function() {});
12 })();
```

Task 3/5

Attach a success to our get call.

```
4 app.controller('StoreController', ['$http'
5   var store = this;
6   store.products = [];
7
8   $http.get("/store-products.json")
9   .success(function(){
10     |
11   });
12 }]);
```

Task 4/5

Name the first parameter of the success function `data`.

```
$http.get("/store-products.json")
.success(function(data){
```

Task 5/5

Give our StoreController access to the products by setting products equal to the data given to us with the http service's success promise.

```
1 (function() {
2   var app = angular.module('gemStore', ['store-directives']);
3
4   app.controller('StoreController', ['$http',function($http){
5     var store = this;
6     store.products = [];
7
8     $http.get("/store-products.json")
9     .success(function(data){
10       store.products = data;|
11     });
12   }]);
13
14  app.controller('ReviewController', function() {});
15 })();
```
